

TABLES OF THE COMBINED METHOD  
FOR DETERMINATION OF AGE AT DEATH  
GIVEN BY NEMESKÉRI, HARSÁNYI AND ACSÁDI\*

by T. SJØVOLD

(Osteological Research Laboratory, University of Stockholm, Stockholm)

This method concerns determination of the age at death of adult individuals based on four age indicators. These are the *endocranial suture closure*, the *symphysis osseum pubis*, and the structure of the *spongiosa* in the proximal epiphysis of the *humerus* and the *femur* as observed when sectioned longitudinally. The first two age indicators may appear in five different age phases, the other two in six.

Originally the method for determination of the age at death using the age indicators jointly was published by NEMESKÉRI, HARSÁNYI and ACSÁDI (1960), but it was later more fully described by ACSÁDI and NEMESKÉRI (1970) with some minor modifications. For the precise definitions and illustrations of the different phases of the age indicators it is referred to either of these two publications, together with which these tables are intended to be used. Because of the minor modifications of the method which had been made, mostly concerning small adjustments of the means and of the calculated upper and lower limits of range, the present tables were calculated by means of the information given ACSÁDI and NEMESKÉRI (1970). All age determinations were calculated to two decimal places, but the age determinations may be rounded off in practical cases. It is, however, important not only to publish the ages determined, but also the sequences of age indicators leading to the determinations.

In calculating the tables all possible combinations of the age indicator phases were taken into account, although some of the combinations are very unlikely to occur in a normal development of ageing. A careful examination of each skeleton is therefore required to reveal pathologic or other causes which may have accelerated or retarded the absolute or relative development of the age indicators, or which may point to quite another stage of ageing than indicated by the combined method. Thus, an over-simplified or a too mechanistic employment of this method in general and of these tables in particular has to be avoided by all means, as stressed in both the publications referred to.

*How to use the tables:* The first five tables (which constitute the main table because all four age indicators are present) are indexed according to the phases I—V of the symphysial face. When the table page of the appropriate *symphysial phase* is found, the sub-table corresponding to the observed phase of the *femur* is sought. In this sub-table the age corresponding to the observed sequence of age indicators is directly read by reading off the age corresponding to the row with the appropriate phase of the *humerus* and the column corresponding to the appropriate phase of *endocranial suture closure*.

*Example:* The observed sequence is: Symphysial face: Phase III, femur: Phase IV, humerus: Phase I and suture: Phase IV.

\* This work was supported by the Swedish Natural Science Research Council, grant no. B2664—010.

Search the table entitled: SYMPHYSIAL FACE: PHASE III, then the sub-table entitled Femur, proximal epiphysis: Phase IV, and look up the age corresponding to the row *Humerus, proximal epiphysis: Phase I* and the column corresponding to *Endocranial suture closure: Phase IV*. The age read is 52.75 years.

The next four tables concern age determinations when one of the age indicators is missing. These tables are indexed by means of the missing age indicator. In the first two tables the sub-tables are headed by the phase of the symphysis, in the other two by the phase of the femur. When the table corresponding to the missing age indicator is found, the age determination is carried out as in the first named (complete) case when the page corresponding to the phase of the symphysis was found.

The last two tables concern the cases when *two* of the age indicators are missing. The one table gives the cases when the one age indicator is the symphysial face, the other the cases when the symphysial face is missing. In these tables the age intervals are explicitly given.

For completeness, in the case when only *one* age indicator is present, the following age intervals, quoted from ACSÁDI and NEMESKÉRI (1970), should be used:

Endocranial suture closure		Symphysial face		Femur, proximal epiphysis		Humerus, proximal epiphysis	
Phase	Age range	Phase	Age range	Phase	Age range	Phase	Age range
I	23—40	I	23—40	I	23—40	I	23—60
II	30—60	II	35—55	II	35—55	II	30—60
III	30—60	III	40—60	III	40—60	III	40—70
IV	40—80	IV	50—70	IV	50—70	IV	40—70
V	40—80	V	60—80	V	50—75	V	50—80
				VI	50—80	VI	50—80

For appropriate age intervals when more than one age indicator is present, see the notes in connection with the tables.

## A Nemeskéri—Harsányi—Acsádi-féle elhalálozási kormeghatározáshoz kidolgozott kombinált módszer táblázatai

Írta: Sjøvold, T.

A felnőtt egyének elhalálozási korának megállapítására vonatkozóan ez a módszer négy életkorú jelzőt vesz meghatározási alapul. Ezek az *endocranialis varratok záródása*, a *symphysis osseum pubis*, valamint a *humerus* és a *femur proximalis epiphysisében* a szivacsos állomány szerkezete, hosszanti metszetekon vizsgálva. Az első két életkorú jelzőt öt, a másik kettő hat különböző életkorú fázisban fordulhat elő.

Az elhalálozási életkor meghatározására szolgáló módszert, amely az életkorai jelzőket veszi figyelembe, eredetileg NEMESKÉRI, HARSÁNYI és ACSÁDI (1960) publikálta, később azonban ACSÁDI és NEMESKÉRI (1970) sokkal részletebben írta le, néhány kisebb módosítással. Az életkorai jelzők különböző fázisainak pontos definiálása és illusztrálása érdekében e két publikáció valamelyikét ajánlatos a jelen táblázatokkal együtt használni. Mivel a módszerrel kapcsolatban történt csekély változtatások főleg a középértékek és a terjedelem alsó és felső határainak bizonyos kieggyenlítésére vonatkoznak, a jelen táblázatok értékeit az ACSÁDI és NEMESKÉRITől (1970) kapott információk segítségével számítottuk ki. Az összes kormeghatározást két tizedes

értékre számítottuk ki, de a gyakorlatban ezek az értékek kerekíthetők. Fontos azonban, hogy ne csak a meghatározott életkorokat publikáljuk, hanem az életkor jelzők sorrendjét is, amelyek a meghatározáshoz vezetnek.

A táblázatokban szereplő értékek kiszámításánál az életkorjelző fázisok minden lehetséges kombinációját számításba vettük annak ellenére, hogy néhány ilyen kombináció valószínűleg nem fordul elő az öregedés normális folyamatában. Minden egyes csontváz gondos átvizsgálása eredményeképpen tehát okvetlenül megmutatkoznak azok a patológiai vagy bármilyen más okok, amelyek az életkor jelzők abszolút, ill. relatív kifejlődését gyorsítják, ill. lassítják, vagy amelyek rámutathatnak esetleg egészen más öregedési stádiumra, mint amit a kombinált módszer alkalmazása során kapunk. Így mindenkorban kerülni kell általában a módszer és különösen a táblázatok nagyon leegyszerűsített, ill. túlságosan mechanistikus használatát, amint erre mindenkorban publikációban nyomatékos utalás találunk.

*A táblázatok használata.* Az első öt oldalt (amely a táblázat fő részét alkotja, mivel mind a négy életkor jelzője van) a *symphysis felszín* I–V. fázisa szerint jelöltük. Ha megtaláltuk a megfelelő *sympysis fázis* tábla-oldalát, keressük meg a *femur* megfigyelt fázisának megfelelő altáblázatot. Ebben az altáblázatban pontosan értelmezhető az életkor, amely megegyezik az életkor jelzők megfigyelt sorrendjével, azáltal, hogy leolvassuk a *humerus* megfelelő fázisának sora és az *endocranialis varratok* záródásának megfelelő fázis oszlopa találkozásánál adódó életkort.

*Példa:* A megfelelő sorrend a következő: *Sympysis felszín*: III. fázis; *femur*: IV. fázis; *humerus*: I. fázis; *varrat*: IV. fázis.

Nézzük a SYMPHYSIS FELSZÍN III. FÁZIS című oldalt, majd az altáblázaton a *Femur, proximalis epiphysis IV. fázisát*. Ezután kikeressük a *Humerus, proximalis epiphysis I. fázisának* megfelelő életkor sorát, végül az *Endocranialis varratzáródás IV. fázisának* megfelelő oszlopot. A leolvastott életkor eszerint: 52,75 év.

A következő négy oldal azokra az életkor-meghatározásokra vonatkozik, amelyeknél az egyik életkor jelző hiányzik. Ezeket az oldalakat a hiányzó életkor jelzői szerint jelöljük. Ezek első két oldalán az altáblázatok a *sympysis fázisa*, a következő kettőt pedig a *femur fázisa* címmel jelöljük. Ha megtaláltuk a hiányzó életkor jelzőnek megfelelő oldalt, az életkor-meghatározást úgy alkalmazzuk, mint az elsőként leírt (hiánytalan) esetben, amikor a *sympysis fázisnak* megfelelő oldalt megkaptuk.

Az utolsó két oldal azokra az esetekre vonatkozik, amikor két életkor jelző hiányzik. Az első oldal azokat az eseteket adjja meg, amelyeknél az egyik korjelző a *sympysis felszíne*, míg a másik azokat, amelyeknél a *sympysis felszín hiányzik*. Ezekben a táblázatokon az életkor intervallumokat kifejezetten megadjuk.

A teljesség kedvéért jegyezzük meg, hogy abban az esetben, ha csak egy életkor jelző van adva, a következő életkor intervallumokat kell használni (ACSÁDI és NEMESKÉRI, 1970 munkájából; a táblázatos összefoglalást lásd a 10. oldalon, az angol nyelvű szövegben!). Ha egynél több életkor jelző áll rendelkezésünkre, a helyes korintervallumok megállapítására lásd a táblázatokkal kapcsolatos jegyzeteket is!

*Note:* The margin of error in individual age determinations according to this table is  $\pm 3$  years above and below the year determined with a confidence of 80—85 per cent. However, for age determinations between 60 and 64 years, the upper limit must be raised to the age of 70, between 65 and 69 to 75, and over 70 years, to the age of 80.

## TWO AGE INDICATORS MISSING
