

SUMMARY

The column of the Studies, Articles and Data begins with the article entitled „The Place of Onomatology Among the Social Sciences" by K. FABÓ. It claims that onomatology is a branch of science standing on the half way between linguistics and other social sciences. Its most important function — the identification — is carried out by the means of the language, but is still has several connections with other social sciences that are mostly undiscovered. The pseudonymous work, the „Problems of Nicknames" begins with the study of the terminology of the Hungarian nicknames (epithets). It represents a detailed study of the internal classification. It distinguishes between the aim, the motive and the emotional atmosphere of sense of name giving and within these suggests separate classification. It says that the study of linguistic material and the situation and the function of usage seem to be neglected, however, these could be aspects of classification as well. Many people have already dealt with the inheritance of names, the author holds it as an unimportant aspect of systematization. L. MIZSER writes about the fact how titles of nobility became surnames or how they disappeared, M. HAJDU writes an introducing a discussion on the „Terminologies of the Hungarian Onomatology". E. RÁCZ, L. BACHÁT and A. SZABÓ T. write their opinions on this theme.
